# CERN - Particle Physics

- Founded in 1954
- Intergovernmental research organisation
- 22 members states
- ~2500 employees
- 12,000 visiting scientists from over 70 countries and with 120 different nationalities
- A different dimension of “collaborative research”
- Central place for HEP: everyone either comes through here or uses CERN data

# Data Policies in HEP

## LHCb External Data Access Policy

### ALICE data preservation strategy

Sunday, October 6, 2013

The data harvested by the ALICE Experiment up to now and the investment in human and financial resources by the international community for the in depth understanding of the profound physics, long term preservation must be an essential objective of the ALICE Collaboration legacy to the scientific community. The ALICE Collaboration call for a detailed assessment of the ALICE data preservation at various levels of abstraction, data access and key elements of such a data preservation strategy allowing future generations to analyze data for educational purposes. The present document describes the basic principles that will guide the ALICE data preservation policy.

## CMS data preservation, re-use and open access policy

CMS data are unique and are the result of vast and long-term moral, human and financial investment by the international community. There is a unique scientific opportunity in re-using these data, at different levels of abstraction, to maximize the scientific value of the data, to ensure the long-term availability of the data, to ensure the maximum use of the data, to ensure the maximum use of the data, to ensure the maximum use of the data.

## ATLAS Data Access Policy

May 21<sup>st</sup> 2014

### Introduction

ATLAS has fully supported the principle of open access in its publication policy. This document outlines the policy of ATLAS as regards open access to data at different levels as described in the DPHEP [1] model. The main objective is to make the data available in a usable way to people external to the ATLAS collaboration.

The ATLAS policy for data preservation is described in a separate document. The collaboration's need to preserve data for its own use shares some requirements with making them open access. To support open access to data additional resources will be required to develop and support the tools to make the data available.

### Policies for Different Data Levels

Open access to ATLAS data by people outside the collaboration can be considered at four levels of increasing complexity, listed below, with associated conditions, see Ref [1]. This

...tive responsibility,  
...ue has ever been

...exity, and to allow  
...e data are taken,  
...ation, educational

...ow the maximum  
...to its data after a  
...loit their scientific

ABOUT SEARCH EDUCATION RESEARCH

## Education

Visualise events, check reconstructed data, run tools or build your own!

Start learning

## Research

Get the genuine working environments, virtual machines and datasets to start your research

Start analysing

The central diagram features a hub-and-spoke structure with a central point from which numerous orange lines radiate to smaller square nodes. Five larger, colored circles containing particle physics symbols are positioned around the center: a red circle with the Greek letter muon ( $\mu$ ), a grey circle with the Greek letter gamma ( $\gamma$ ), a blue circle with the Greek letter tau ( $\tau$ ), a green circle with the letter 'e' (electron), and a yellow-green circle with the letter 'q' (quark). A diagonal teal line runs from the top right towards the bottom left, passing through the central hub.

# Gettings “things done”: Community workshop

Information Summit from/for Astronomy, Astrophysics and High-Energy Physics

- Workshop series taking place every 1.5 years with all stakeholders from publishing, repositories, indexing services, researchers

Last one: May 2017, focused on data, software, ORCID etc.

- What are the challenges specific to this community?
- How can we address them?
- What are the next steps?

Discussion and results from workshop

# Data and Software

- Focus on data availability statements and data citation
- Springer Nature example showed flexibility in data policies: opportunity for community to tailor to specific needs
- Pressure vs. feasibility, mandates vs. voluntary measures

## Challenges and solutions:

- Community-relevant publishers chair discussion on potential policies and implementations - take the driver's seat
- Indexing services: give data more visibility
- Improve collaboration and communication, e.g. lessons learnt
- Need for community awareness: organise joint sessions at conferences

# ORCID: What is it?

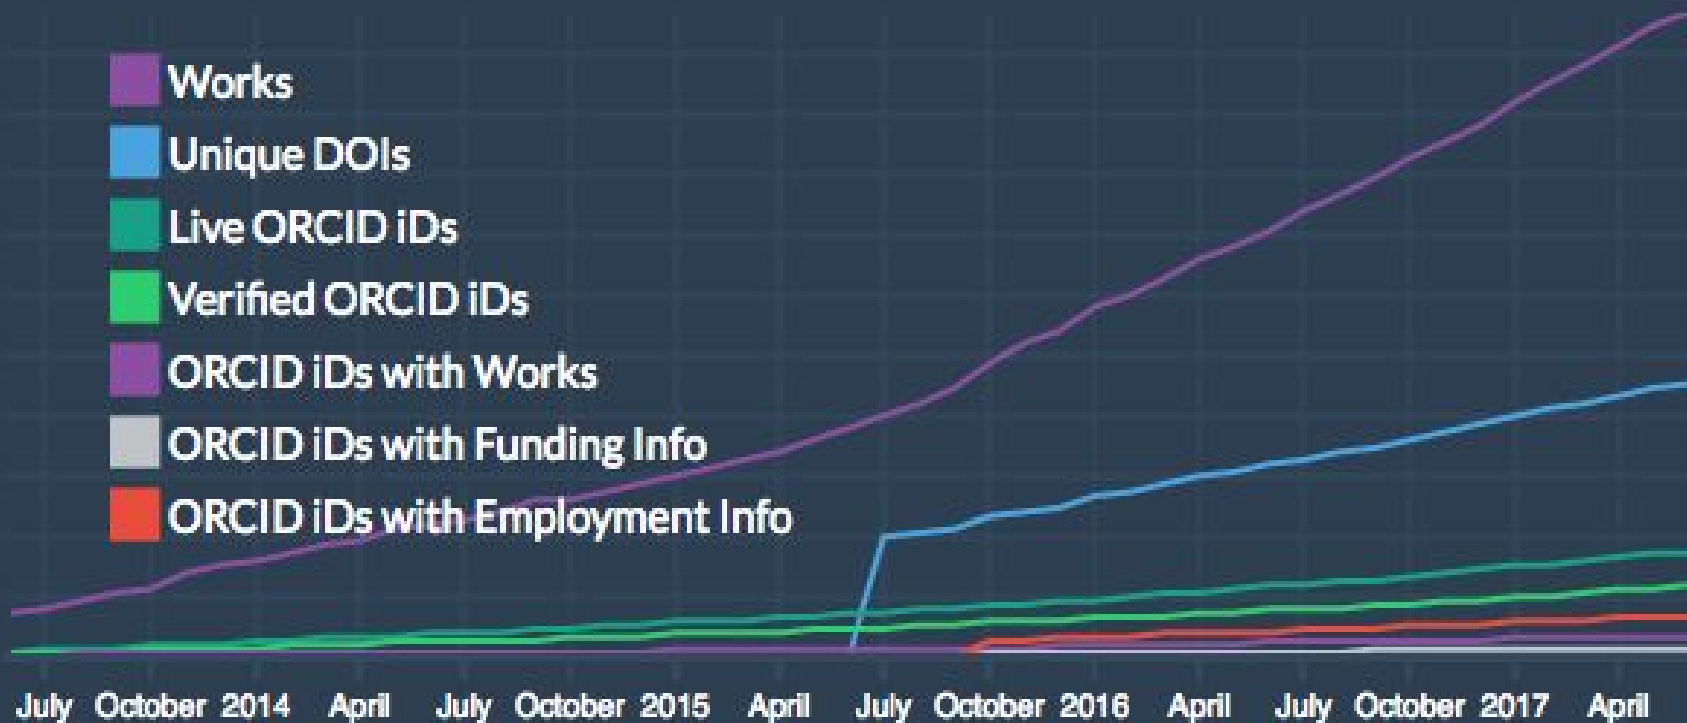

- An identifier for researchers
- A registry
- A set of standard procedures for connecting researchers to their affiliations and activities
- A committed community building connectors
- An international-scale open research effort
- If implemented well, could make “submissions” (repositories, journals) and updates easier

Core challenge in HEP: interoperability and adoption

# overview

- Works
- Unique DOIs
- Live ORCID iDs
- Verified ORCID iDs
- ORCID iDs with Works
- ORCID iDs with Funding Info
- ORCID iDs with Employment Info

Technical and Human  
infrastructure  
for Open Research

[project-thor.eu](http://project-thor.eu)

Our goal is to ensure that every researcher, at any phase of their career, or at any institution, will have seamless access to Persistent Identifiers (PIDs) for their research artefacts and their work will be uniquely attributed to them

# Lessons Learnt

- Work with each individual community and take into account the challenges specific to them
- Take hesitation, expectations and different positions into consideration
- Discuss openly advantages and disadvantages of possible approaches
- One-size-fits-all approaches can be challenging; providing adjustable solutions may work better
- Learn from experience (e.g. Springer Nature)

# Metrics

- Traditional metrics:
  - important role in community,
  - special role of indexing services
- Alternative metrics:
  - low interest in HEP community so far
  - Important to consider a wide range of sources
- Metrics for new scholarly materials, e.g. data and software
  - There is “little” to count still, more of a social challenge
  - Important to start “counting” the publications first, prepare to show reuse ⇒ already implemented

# LHC Policies

- Open data for three levels
- Immediate release for level 1 (with publication)
- Embargo periods for level 3
- Exploitation within the collaboration
- CC0 – public domain dedication
- Data citation

# Data in HEP - Use Cases
